puzzle some pennies are placed on the infinite line $\mathbf{Z}$. the following moves are allowed:
i. removing two pennies at $n-1$ and at $n+1$ for a single penny at n.
ii. vice versa, removing a penny at n for two pennies at $n-1$ and at $n+1$.
show that from a starting state of a single penny at 0 we can reach an end state of a single penny at 6.

exercise how is the above related to the fact that $x^2 - x + 1 \mid x^6 - 1$?
